DETAILED ACTION

Information Disclosure Statement

1. The listing of references in the specification is not a proper information disclosure statement. 37 CFR 1.98(b) requires a list of all patents, publications, or other information submitted for consideration by the Office, and MPEP § 609 A(1) states, "the list may not be incorporated into the specification but must be submitted in a separate paper." Therefore, unless the references have been cited by the examiner on form PTO-892, they have not been considered.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gopinathan et al 5,819,226 in view of Sheppard 6,026,397. Gopinathan '226 shows a computer process to determine the risk of a transaction receiving data from the a transaction between a customer and merchant; determine which cluster associates (SIC code & Factor Group) with the merchant's name in the transaction and applying that cluster in conjunction with data derived from the transaction to a predictive model to determine the level of risk and estimating the likelihood of a fraudulent transaction (col.

Art Unit: 3671

1, lines 27-42; claims 2, 7 and 9), but fails to show a plurality of merchant clusters are determined by statistical occurrences of the merchant names in transactions. However, Sheppard '397 shows converting data/high categorical data like words, names, etc (col. 1, lines 39-54) such as merchant names into clusters (36) that included lookup tables where each name/data entry is unique (claim 4) and derived from raw merchant names/raw data (element 34 and col. 2, lines 1-10; claim 5) is vital to the predictive model (38) and creating a factor (affinity) from the clustering to be used in the model (claims 6 and 15-17). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify, as taught by Sheppard, to include merchant name clustering and segmenting of the merchant names into data to supplement a predictive model in order to gain great clarity over the SIC factors since it does not capture segmentation details (transaction statistics) that would improve the ability to detect fraud in the model of Gopinathan and thus the risk involved with particular merchants in a particular segmentation as better defined than the SIC codes (Sheppard; col. 20, line 44). Gopinathan further shows whether to approve or decline a transaction based on the level of risk (col. 25-26, lines 60-68; claim 3) and risk factors for each cluster/segment (SIC Factor; claim 8). Gopinathan further shows transaction statistics such as volume and amount (col. 7, lines 29-34 and col. 8, lines 1-34; claims 10-13).
